```
fermenting recombinant microorganisms expressing genes for suitable entymes in the presence of glycerol or glucose -
3-Hydroxypropionic acid preparation, for use e.g. as monomer, by
```

Claim 5; Page 32-35; 63pp; English.

Incorporation of genes encoding two euzymes makes the host organisms able to produce (3:HP) from (1). The biotechnological method of from preparing (3:HP) is potentially cheaper than chemical synthesis. The present sequence represents the human aldehyde dehydrogenase ALDH2, which recombinant microcrafts (1) in the presence of a source of glycerol (1) or glucose, where the microorganism: (1) expresses genes for non-native enzymes which catalyse the production of (340) from (1); (1) carries genetic constructions for the expression of a glycerol dehydratase (GDHT) and aldehyde dehydrogenase (ADH) capable of catalysing the production of (3.40) from (1); or (11) arries a genetic construct which expresses the dhab gene from Klebsiella pneumoniae and a gene for an ADH capable of catalysing the production of (3.40) from (1). 3.40 is a monomer, and is useful e.g. in the production of absorbable prosthetic devices and surgical sutures or for incorporation into beta-lactans, production of arrivitic acid or formation of triflucromethylated alcohols 3-hydroxypropionic acid (3-HP). The method comprises fermenting a or diols, polyhydroxyalkonates and copolymers with lactic acid. The present invention describes a method for the production of is used in the exemplification of the present invention.

The polymorphic ALDHS variant is useful in studying the effect of the variation on the biological activity of ALDHS and on the binding affinity of candidate drugs targeting ALDHS for the freatment of alcoholism and alcohol-induced disorders. Polymurleotides comprising a pelymorphic gene variant or fragment may be used for theirapeutic purposes. ALDHS protein isoforms may be used for theirapeutic proteins affinities of one or more candidate drugs targeting the ALDHS proteins may be used to generate at the protein seed by scientists to yalidate ALDHS as a candidate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                62 KAREGRPGAFQLGSPWRRMDASHSGRLLARLADJLERDRITTAALELLDNGKPYVTSTLV 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ALDH5 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression of function. The products of the invention have antial coholic activity. This sequence represents the human ALDH5 polymorphic variant protein described in the
                                                                                                                                                                                                                                                                                                                            process. ALDH's proteins may be used to generate antibodies Haplotyping method can be used by scientists to validate ALDHS as a candidate target for treating a specific condition or disease predicted to be associated with ALDHS activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with ALDHS activity. Information or disease predicted to be associated with ALDHS activity. Information on polymorphisms on the ALDHS gene can be applied for studying the biological function of
                                                                                                                                                                                                                             alcoholism and alcohol-induced disorders. Polynucleotides comprising a polynorphic gene variant or fragment may be used for therapeutic purposes. ALDHS protein isoforms may be used in assays to measure the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       182 PALATGNVVVMKVAEQTPL/TALYVANLIKEAGFPPGVVNIVPGFCPTAGAAIASHEDVDK

A novel retro virus vector encodes human cytosolic aldebyde-
dehydrogenise and/or human eineamyleysteinesyntherise. (ARE 4673).
Hematopolicie ocils transferted by the vector are resistant to
eyelegischemide, providing a means of year therapy that allows
higher doses of toxic drugs to be used in cancer chemotherapy.
The human genes may also be used as selectable markers for
mammalian cell transfection and for transgenic animal breeding.

endometrics is by determining the amount of gene product from at least one specific gene in a patient sample and comparing this with the amount of gene product in a patient sample and comparing this with the amount of gene product in a central sample and comparing this with the amount of gene product in a central sample as a reduced level is indicative or all adopted dehydrogenase 6, gravin, phosphelipase C epsilon, elastin, insulin-like growth factor binding practicines, alpha 2 type IV collagen, transmembrane receptor binding practicines, alpha 2 type IV collagen, platelet derived growth factor receptor alpha, laminin M chain, subtilish like protein PARY or indogen type AVIII alpha 1.

Subtilish like protein PARY or indogen the more lamining and protein participals, and also for inconfections and treatment of the disease. The present sequence is human aldebyde

Claim 20; SEQ ID No 36446; 103pp; English

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase thain reaction (PCE) primers. Objodicts, and for chromosome and green mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders invoiving derivant expression or biological activity the polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               307

Novel acetyl CoA synthetaso (ACS), plastidic pyruvate dehydrogenase (PPDH), ATP citrate lyase (ACL), pyruvate decarboxylase (PDC) and aldehyde dehydrogenase (ALDH) polypeptides used to alter acetyl CoA levels in plants

Examples; Fig 10B; 79pp; English.

biosynthesis of very long chain fatty acids and flavonoids. The enzymes may also be used for in vitro synthesis of acctyl CoA, which in turn can be used to produce acetyl CoA phytochemicals (plastidic ACS, pppH, ACL, pyruvate decalboxylase, acetyl CoA phytochemicals, mitochondrial pyruvate dehydrogenase and aidehyde dehydrogenase are involved in the biosynthesis The invention provides nucleic acids encoding Arabidopsis plastidic acetyl CoA synthetase (ACS), various subunits (specifically the E3 subunit) of plant plastidic pyruvate dehydrogenase (pPDH), the A and B subunits of a plant ATP citrate lysse (ACL), Arabidopsis pyruvate decarboxylase (PDC), Arabidopsis aldehyde dehydrogenase (ALDH), specifically ALDH-2 and ALDH 4. The polypeptides can be expressed by standard recombinant methodology. The ACS, pPDH, ACL, PDC and ALDH polypeptides, methods and nucleic acid molecules of the invention are used to alter the level of acetyl COA in a plant or plant cell, tissues or organs.

Novel acetyl CoA synthetase (ACS), plastidic pyruvate dehydrogenase (PDDH), ATP citrate lyase (ACL), pyruvate decarboxylase (PDC) and aldehyde dehydrogenase (ALDH) polypeptides used to alter acetyl CoA levels in plants

Examples; Fig 12B; 79pp; English.

The invention provides no leic acids encoding Arabidopsis plustidic accty! CoA synthetase (ACS), various subunits (specifically the Establushis) of plant plastidic pyrovate debydroquase (PPH), the A and B subunits of a plant ATF citrate lyase (ACL), Arabidopsis pyrivate decarboxylase (PDC), Arabidopsis aldehyde debydroquase (ALDH), specifically ALDH-2 and ALDH-4. The polypeptides can be expressed by standard recombinant methodology. The ACS, PPDH, ACL, PPC and ALDH polypeptides, methods and nucleic acid molecules of the invention are used to after the level of accty! CoA in a plant or plant cell, tissues The enzymes or organs. A decrease in acetyl CoA is expected to affect the biosynthesis of very long chain fatty acids and flavonoids. If (FEKE) PE CORP NY

The invention is useful in developmental blology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genemic DNA sequences (ABL16175-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           associated with the alcohol dehydrogenase I (alcA) gene and the aldehyde dehydrogenase (aldA) gene of A. nidulans or naturally associated with the quotoanylase gene in Aspergillus niger may be used. The DNA construct may contain a promoter region in operative association with a signal peptide coding region. The promoter/signal construct is suitably provided with a flanking restriction site to allow previse coupling of the protein coding region to the signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         allergens and sequences encoding them have now been isolated. The mature Clah53 allergen has mol. wt. 53 kD and is encoded by cDNA sequence AAG86278. The allergen has bemology to aldebyde dehydrogenases. Potential epitopic subfragments were identified by computer analysis of the amino acid sequence. See AAR71492.871906 for potential B cell epitopes and AAR72615.8726.27 for potential I cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Albergens derived from Cladosporium berbarum spores—also recombinant DNA for expressing the albergens, useful for in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Spores of Cladosporium herbarum are the most common fundal spores found in the air; they can cause allergic reactions.
